

CADS platform: data, computation and access

A target context view for §6.1 — the database and computation remain separate responsibilities.

Target view, not a deployment-completion claim. Amber dashed box: connector design to agree with Kaizen.
Prototype coverage: workflow execution and demo dashboard; database read/write and full access control remain pending.

One execution contract, different model roles

A module view for §6.2 — workflows choose the connections; module categories do not impose an execution order.

The same runtime interface applies to all module roles. Numerical connections are defined by each workflow.
Prototype: sequential final-output handoff with placeholder models. Further coupling patterns require implementation and validation.

Inside the prototype: launch, execute, return results

A technical view for §6.3 — hosted dashboard path; each submitted workflow runs its FMUs in one runner process.

Shared data access: a workflow run from start to finish

A proposed integration view — option 2 separates database responsibilities from the model FMUs.

Deployment choice remains open: workflow adapter, service, or FMU with explicit runtime lifecycle support.

Proposed batch-oriented contract: preserve site scope, input-batch ID, run ID, model/workflow versions and timestamps.
The current runner cannot keep a connector FMU alive between steps. A background FMU needs additional coordination.
